### Patient Summary

Patient Name: Last Name, First Name  
DOB: DD-MMM-YYYY

Requisition #: #####	Gender: Female	Collected Date: DD-MMM-YYYY
Ordered by: Dr. Joe, John	Specimen ID: SP19-123	Received Date: DD-MMM-YYYY
Account: John Doe Hospital	Specimen Source: Left Breast	Report Date: DD-MMM-YYYY

#### YOUR RESULTS

MammaPrint® Index (MPI): -0.355  
BluePrint® Subtype: Basal-type

**HIGH RISK**  
Basal-type

---

#### EXPECTED OUTCOME BASED ON YOUR RESULTS\*

For patients with MammaPrint **HIGH RISK**

<b>5-Year Metastasis-Free Survival</b> Hormone Therapy + Chemo	<b>Absolute Chemotherapy Benefit</b> Average
<b>93%</b>	<b>&gt;12%</b>

---

#### Expected Outcome Based on Your MammaPrint Results Combined With Clinical Risk Assessment†

<b>5-Year Metastasis-Free Survival†</b> Hormone Therapy + Chemo	
MammaPrint HIGH RISK + Clinical Low Risk	96%
MammaPrint HIGH RISK + Clinical High Risk	91%

\*Your clinical risk assessment is based on clinical factors alone. See glossary for more information. Discuss with your doctor to determine if you are clinically low or clinically high risk.

#### SUMMARY

##### Potential chemotherapy benefit.

Your MammaPrint + BluePrint results indicate your cancer subtype is High Risk Basal-type. Studies have shown that MammaPrint High Risk Basal-type patients derive a significant benefit from the addition of chemotherapy, similar in response to patients who are "triple negative" by standard pathology.<sup>2,3</sup>

- The patient's individualized results
  - MammaPrint® Index
  - BluePrint® subtype
- From the MINDACT trial, observed 5-year DMFS of 93% for MammaPrint HIGH Risk patients treated with CT
- Chemotherapy benefit data as observed from Knauer et al, demonstrated a 12% absolute benefit of CT for MammaPrint HIGH Risk patients-5yr DMFS: 88% (with CT) vs 76% (ET Alone)
- Combined clinical and genomic risk information provided to help further refine risk prognosis
- Simplified summary statement for patients. Easily interpret what impact the results may have on potential treatment decisions

## Interpreting the new MammaPrint® and Blueprint® patient summary

### REVERSE

## Patient Summary

---

**\*EXPECTED OUTCOMES BASED ON YOUR RESULTS**

**5-Year Metastasis-Free Survival:** This is the percentage of patients whose cancer did not spread from the original tumor to distant sites after 5 years when treated with hormone therapy and chemotherapy. These results were observed in ER+, LN- patients in the MINDACT trial.<sup>1</sup>

**Absolute Chemotherapy Benefit (average):** A 12% increase in 5-year distant metastasis-free survival was observed among MammaPrint High Risk patients, including both LN+ and LN-, who were treated with hormone therapy and chemotherapy versus those who were treated with hormone therapy alone in a study by M. Knauer.<sup>2</sup> This 12% difference is considered statistically significant, meaning the results are definitive and not due to chance.

---

### GLOSSARY OF TERMS

**Cancer/Molecular Subtype:** In breast cancer, most studies divide breast cancer into four major molecular subtypes: Luminal A, Luminal B, Triple-negative/Basal-like, and HER2 type. The BluePrint subtypes are defined by these active biological pathways. Knowing your cancer's subtype can help determine the best course of treatment.

- Luminal-type:** Luminal-type cancers are typically hormone receptor-positive tumors and are likely responsive to hormonal therapy.
- Basal-type:** Basal-type cancers are typically "triple-negative" for ER, PR and HER2 receptor expression. These tumors typically do not respond to hormone therapy or anti-HER2 targeted therapy. Basal-type cancers tend to grow more rapidly.
- HER2-type:** HER2-type cancers tend to grow more rapidly and may recur, although they can often be treated with anti-HER2 targeted therapies such as trastuzumab, pertuzumab and lapatinib.

**Chemotherapy:** Chemotherapy can be an effective treatment for properly selected patients. It is called a systemic therapy because the drugs enter the bloodstream and travel throughout the body. It works by killing cells that divide rapidly, like cancer cells. Side effects may include hair loss, nausea, mouth sores, nerve damage, and other problems.

**Clinical Risk:** The estimated risk of recurrence based on clinical factors alone, such as receptor status, tumor size, tumor grade, and lymph node status.

}

**Hormone Therapy (anti-estrogen):** Treatment typically used with breast cancers that are "estrogen receptor-positive" (ER+) and/or "progesterone receptor-positive" (PR+). Some tumors need estrogen and/or progesterone to keep growing. Hormone therapy either stops your body from making those hormones, or blocks the receptors so the cancer cannot use the hormones for its growth.

**"Low/High Risk" MammaPrint Results:** The MammaPrint test classifies your breast cancer as having either a "Low Risk" or a "High Risk" of recurrence. A MammaPrint "Low Risk" result indicates low likelihood of your cancer recurring, and a "High Risk" result indicates higher likelihood of your cancer returning.

**Metastasis/Distant Metastasis:** The spread of cancer cells from the original (primary) tumor to distant organs or distant lymph nodes. The absence of metastasis in a given time period is also referred to as Distant Metastasis-Free Survival (DMFS).

**Node-Negative (also known as Lymph Node-Negative or LN-):** When lymph nodes are free, or clear, of cancer.

**Node-Positive (also known as Lymph Node-Positive or LN+):** A finding of cancer cells in the lymph nodes.

**Statistically Significant:** A difference in results that is not attributed to chance, or in other words a reliable result.

**MammaPrint® FFPE** is a qualitative in vitro diagnostic test, performed in a central laboratory, using the gene expression profile obtained from formalin-fixed paraffin embedded (FFPE) breast cancer tissue samples to assess a patient's risk for distant metastasis within 5 years. The test is performed for breast cancer patients, with Stage I or Stage II disease, with tumor size ≤ 5.0 cm and lymph node negative. The MammaPrint result is indicated for use by physicians as a prognostic marker only, along with other clinico-pathological factors. **BluePrint®** was developed and its performance characteristics determined by Agendia. It has not been cleared or approved by the US Food and Drug Administration (FDA). The FDA has determined that such clearance or approval is not necessary. This test is used for clinical purposes. It should not be regarded as investigational or for research. This laboratory is certified under the Clinical Laboratory Improvement Amendments (CLIA) as qualified to perform high-complexity clinical laboratory testing. It has also been CE-marked for use in Europe.

As observed in MINDACT, MammaPrint HIGH risk patients achieved a 93% DMFS at 5-years when treated with chemotherapy in addition to endocrine therapy

Helpful and patient friendly glossary of terms

Dedicated area for patients to take notes on treatment decisions, helpful information or other details

**MammaPrint®** FFPE is a qualitative in vitro diagnostic test, performed in a central laboratory, using the gene expression profile obtained from formalin-fixed paraffin embedded (FFPE) breast cancer tissue samples to assess a patient's risk for distant metastasis within 5 years. The test is performed for breast cancer patients, with Stage I or Stage II disease, with tumor size ≤ 5.0 cm and lymph node negative. The MammaPrint® FFPE result is indicated for use by physicians as a prognostic marker only, along with other clinico-pathological factors.

**BluePrint®** is a laboratory-developed test that was developed, validated and is performed exclusively by Agendia. The test is intended for clinical purposes. The test has not been cleared by the U.S. Food and Drug Administration (FDA) but has been CE-marked for use in Europe. The laboratory is regulated under the Clinical Laboratory Improvement Amendments (CLIA) to ensure the quality and validity of the tests. Our laboratories are CAP-accredited and certified under CLIA to perform high complexity clinical laboratory testing.
